TITLE	Description
“Spirometry Data Analysis and Classification Using Artificial Neural Network”	The project involved implementation Spirometry data such as Forced Expiratory Volume in 1 second (FEV1), Force Vital Capacity (FVC) and Small Vital Capacity was carried out using Spirometer. At present numbers of lung diseases are major threat to the human health due to air Pollution, smoking and other infections. The various Artificial Neural Network methods for the classification of Spirometry data are Back Propagation Network (BPN), Radial Basis Function (RBF) and Multilayer Perceptron Neural Network (MLPNN). The aim of the project is to acquire parameter such as FVC, FEV1 and SVC data and use unsupervised Artificial Neural Network for classification of the Spirometer data into Normal, Obstructive and Restrictive dataset..

B.E Projects

TITLE	Description
“ Portable Network Security System ”	Portable Network Security System is basically tool for network enabled system to protect peer terminals from external unwanted attack. Application provides the Listing Network enabled port, data transfer method for port scanning. Port scanning is one of the most popular technique to discover and map services that are listening on a specified port. This project also provides the content based protection from the network with the file and folder content blocking if it is dangerous for system. Application also provides also provides interaction with the Linux O.S to define the all network based security trends. Packet filtering is most commonly used as a first line of defense against attacker from machine outside LAN. The IP Scanning is used in checking the entire computer IP’S connected in a LAN. It gives the status of the IP’S connected to the main server.
